

Testing. I am testing

So this is the first page.

Should inaugurate (sp?) with some
pictures. Here is one:

That isn't so bad. How about this:

Find the
volume.

13.10.2011

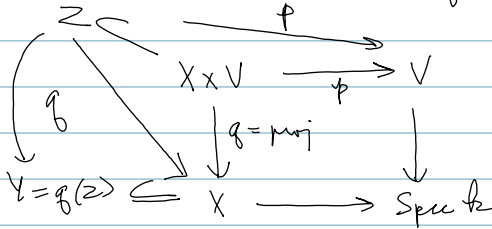

Lecture 3

§5.1 from the book:

V projective variety, $X = \mathbb{A}^N_K$ K field
 Think of $X \times V = \text{total sp.}$ of the trivial $\text{rk } N$ v.b. \mathcal{E}_e on V .

$\mathcal{I} \subseteq \mathcal{E}_e$ subbundle.

$Z \subseteq X \times V$ total space of \mathcal{I}

Have short exact seq:

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{E} \rightarrow \mathcal{T} \rightarrow 0$$

$$s = \text{rk } \mathcal{I}, \quad t = \text{rk } \mathcal{T}, \quad A = k[X]$$

= poly ring in N variables / k .

Set $\mathcal{Z} = \mathcal{T}^*$

Proposition:

(a) A locally free resolution of \mathcal{O}_Z as an $\mathcal{O}_{X \times V}$ -module is given by

$$K_*(\mathcal{Z}): 0 \rightarrow \Lambda^t(p^*\mathcal{Z}) \rightarrow \dots \rightarrow \Lambda^2(p^*\mathcal{Z}) \rightarrow (p^*\mathcal{Z}) \rightarrow \mathcal{O}_{X \times V} \rightarrow 0$$

The differentials are homogeneous of degree 1 in the coordinate functions of X .

(b) $p_*\mathcal{O}_Z$ can be identified with the sheaf of alg. Syri (\mathcal{I}^*) .

Proof:

(b) is obvious.

(a) Identify X with an N -dim k -v.s. E .

By the universal property of Grassmannians $\exists!$ map

$$f: V \rightarrow \text{Grass}(s, E)$$

$$\text{s.t. } \mathcal{S} = f^* \mathcal{R}. \quad \mathcal{R} \text{ \textit{rank} } s \text{-bundle}$$

On $E \times \text{Grass}(s, E)$, $\mathcal{O}_{\mathcal{R}}$ is resolved as follows:

$$K_0(\sigma) \quad \rightarrow \quad \Lambda^2 p^* \mathcal{Q}^* \rightarrow p^* \mathcal{Q}^* \rightarrow \mathcal{O}_{E \times \text{Grass}(s, E)} \rightarrow 0$$

where σ is the section of $p^* \mathcal{Q}$ given by the picture

$$\begin{array}{ccc} p^* \mathcal{Q} & \longrightarrow & \mathcal{Q} \\ \sigma \uparrow & & \downarrow \\ E \times \text{Grass} & \xrightarrow{p} & \text{Grass}(s, E) \end{array}$$

Define $K(\xi) = f^* K(\sigma)$

$K_0(\xi)$ resolves $\mathcal{O}_{\mathcal{Z}}$ as an $\mathcal{O}_{X \times V}$ -module.

Notation: $K_0(\xi, \mathcal{V}) = K_0(\xi) \otimes p^* \mathcal{V}$ for \mathcal{V} a locally free sheaf on V .

Main Thm : (5.1.2) Let $F(\mathcal{V})_i := \bigoplus_{j \geq 0} H^j(V, \wedge^{i+j} \mathcal{V}) \otimes_k A(-i-j)$
of degree 0

(a) \exists minimal diffs $\forall d_i: F(\mathcal{V})_i \rightarrow F(\mathcal{V})_{i-1}$ s.t.

$F(\mathcal{V})_0$ is a cplx of f.g free graded

A -modules with homology

$$H_{-i}(F(\mathcal{V})_0) = R^i q_* M(\mathcal{V}) \quad \forall i \in \mathbb{Z}$$

where $M(\mathcal{V}) = M := \mathcal{O}_Z \otimes p^* \mathcal{V}$. Note

$k_0(\mathbb{P}^n, \mathcal{V})$ is a locally free resolution of $M(\mathcal{V})$

(b) $R^i q_* M(\mathcal{V}) = H^i(Z, M(\mathcal{V}))^\sim$ and can be identified with $H^i(V, \text{Sym}(S^*) \otimes \mathcal{V})$.

Remark : $F(\mathcal{V})_0$ looks like

$$F(\mathcal{V})_2 \xrightarrow{d_2} F(\mathcal{V})_1 \xrightarrow{d_1} F(\mathcal{V})_0 \xrightarrow{d_0} F(\mathcal{V})_{-1} \rightarrow \dots$$

d_i is minimal if $\text{Im } d_i \subseteq m_A \cdot F(\mathcal{V})_{i-1}$

where m_A is the homogeneous \wedge ideal of $A = \text{poly } / k$.

$F(\mathcal{V})_0$ is exact in positive degrees.

Suppose that $R^i q_* M(\mathcal{V}) = 0 \quad \forall i > 0$. By minimality of the maps d_0, d_1, \dots and using NAK, we see $F(\mathcal{V})_{-i} = 0 \quad \forall i > 0$.

Explanation : BWOC, suppose that $n > 0$ is max s.t. $F(\mathcal{V})_{-n} \neq 0$. Then cplx looks like

$$F(\mathcal{D})_{-n+1} \xrightarrow{d_{-n+1}} F(\mathcal{D})_{-n} \rightarrow 0$$

$$F(\mathcal{D})_{-n} = \sum d_{-n+1}$$

Since $R^i f_* M(\mathcal{D}) = 0$.

By minimality - $\sum_{F(\mathcal{D})_{-n}} (d_{-n+1}) \subseteq M_A F(\mathcal{D})_{-n}$.

These are graded modules: By Nak, $F(\mathcal{D})_{-n} = 0$.
 $\Rightarrow \Leftarrow$

If $\mathcal{D} = \mathcal{O}_Y$, then we will write F_* for $F(\mathcal{D})_*$.

Theorem: Suppose that $g: Z \rightarrow Y$ is birational.

(a) $f_* \mathcal{O}_Z$ is the normalization of $K[Y]$ (cond ring of Y)

(b) $R^i f_* \mathcal{O}_Z = 0 \quad \forall i > 0$

$\Rightarrow F_*$ is a finite free resolution of the normalization of $K[Y]$.

(c) $R^i f_* \mathcal{O}_Z = 0 \quad \forall i > 0$ and $rk F_* = 1$
then Y is normal and has rational singularities

(d) Conversely if Y is normal and has rational singularities, then F_* is a graded minimal free resn of $K[Y]$.

Defn: 1) Z, Y varieties k , Z smooth, $f: Z \rightarrow Y$
proper, birational is called a desingularization
or a resolution of singularities.

2) Say that f is a rational resolution if the
following holds

(a) Y is normal, i.e. $f_* \mathcal{O}_Z \simeq \mathcal{O}_Y$

(b) $R^i f_* \mathcal{O}_Z = 0 \quad \forall i > 0$

(c) $R^i f_* \omega_Z = 0 \quad \forall i > 0$.

In characteristic zero (c) is not needed by
Grauert-Remmert.

We say Y has rational singularities if Y
admits a rational resolution (eg every resolu-
tion is rational).

Prop: (b), (c), (d) of the second then
follow from (a) and the Main Theorem.

Under the hyp of (b), F_0 looks like (from Prop)

$$F_2 \rightarrow F_1 \rightarrow F_0 \rightarrow 0$$

By Main Thm homology at 0th spot is $f_* \mathcal{O}_Z$.

Part (a) implies above = normalization $k[Y]$.
