

AVL Trees – Height-Balanced Search Trees

Madhavan Mukund

<https://www.cmi.ac.in/~madhavan>

Programming and Data Structures with Python

Lecture 20, 02 Nov 2023

Operations on search trees

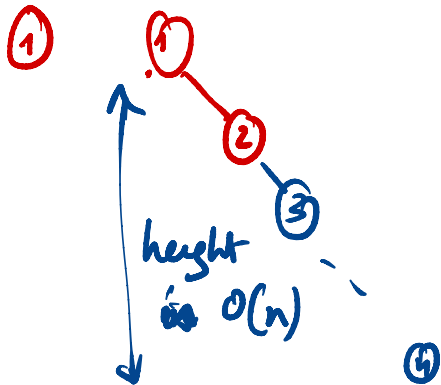

- `find()`, `insert()` and `delete()` all walk down a single path
- Worst-case: height of the tree
- An unbalanced tree with n nodes may have height $O(n)$
- Balanced trees have height $O(\log n)$
- How can we maintain balance as tree grows and shrinks

Operations on search trees

- `find()`, `insert()` and `delete()` all walk down a single path
- Worst-case: height of the tree
- An unbalanced tree with n nodes may have height $O(n)$
- Balanced trees have height $O(\log n)$
- How can we maintain balance as tree grows and shrinks

Insert $1, 2, \dots, n$ into empty $\&$

Operations on search trees

- `find()`, `insert()` and `delete()` all walk down a single path
- Worst-case: height of the tree
- An unbalanced tree with n nodes may have height $O(n)$
- Balanced trees have height $O(\log n)$
- How can we maintain balance as tree grows and shrinks

Defining balance

- Left and right subtrees should be “equal”
 - Two possible measures: `size` and `height`

Operations on search trees

- `find()`, `insert()` and `delete()` all walk down a single path
- Worst-case: height of the tree
- An unbalanced tree with n nodes may have height $O(n)$
- Balanced trees have height $O(\log n)$
- How can we maintain balance as tree grows and shrinks

Defining balance

- Left and right subtrees should be “equal”
 - Two possible measures: `size` and `height`
- `self.left.size()` and `self.right.size()` are equal?
 - Only possible for **complete** binary trees

Operations on search trees

- `find()`, `insert()` and `delete()` all walk down a single path
- Worst-case: height of the tree
- An unbalanced tree with n nodes may have height $O(n)$
- Balanced trees have height $O(\log n)$
- How can we maintain balance as tree grows and shrinks

Defining balance

- Left and right subtrees should be “equal”
 - Two possible measures: `size` and `height`
- `self.left.size()` and `self.right.size()` are equal?
 - Only possible for **complete** binary trees
- `self.left.size()` and `self.right.size()` differ by at most 1?
 - Plausible, but difficult to maintain

Height balanced trees

- `self.height()` — number of nodes on longest path from root to leaf
 - 0 for empty tree
 - 1 for tree with only a root node
 - $1 + \max$ of heights of left and right subtrees, in general

Height balanced trees

- `self.height()` — number of nodes on longest path from root to leaf
 - 0 for empty tree
 - 1 for tree with only a root node
 - $1 + \max$ of heights of left and right subtrees, in general
- Height balance
 - `self.left.height()` and `self.right.height()` differ by at most 1
 - AVL trees — Adelson-Velskii, Landis

height is $O(\log n)$?
how to maintain?

Height balanced trees

- `self.height()` — number of nodes on longest path from root to leaf
 - 0 for empty tree
 - 1 for tree with only a root node
 - $1 + \max$ of heights of left and right subtrees, in general
- Height balance
 - `self.left.height()` and `self.right.height()` differ by at most 1
 - AVL trees — Adelson-Velskii, Landis
- Does height balance guarantee $O(\log n)$ height?

Height balanced trees

- `self.height()` — number of nodes on longest path from root to leaf
 - 0 for empty tree
 - 1 for tree with only a root node
 - $1 + \max$ of heights of left and right subtrees, in general
- Height balance
 - `self.left.height()` and `self.right.height()` differ by at most 1
 - AVL trees — Adelson-Velskii, Landis
- Does height balance guarantee $O(\log n)$ height?

- Minimum size height-balanced trees

Height balanced trees

- `self.height()` — number of nodes on longest path from root to leaf
 - 0 for empty tree
 - 1 for tree with only a root node
 - $1 + \max$ of heights of left and right subtrees, in general
- Height balance
 - `self.left.height()` and `self.right.height()` differ by at most 1
 - AVL trees — Adelson-Velskii, Landis
- Does height balance guarantee $O(\log n)$ height?

- Minimum size height-balanced trees

Pattern

Height balanced trees

- `self.height()` — number of nodes on longest path from root to leaf
 - 0 for empty tree
 - 1 for tree with only a root node
 - $1 + \max$ of heights of left and right subtrees, in general
- Height balance
 - `self.left.height()` and `self.right.height()` differ by at most 1
 - AVL trees — Adelson-Velskii, Landis
- Does height balance guarantee $O(\log n)$ height?

- Minimum size height-balanced trees

Height balanced trees

- `self.height()` — number of nodes on longest path from root to leaf
 - 0 for empty tree
 - 1 for tree with only a root node
 - $1 + \max$ of heights of left and right subtrees, in general
- Height balance
 - `self.left.height()` and `self.right.height()` differ by at most 1
 - AVL trees — Adelson-Velskii, Landis
- Does height balance guarantee $O(\log n)$ height?

- Minimum size height-balanced trees

- General strategy to build a small balanced tree of height h
 - Smallest balanced tree of height $h-1$ as left subtree
 - Smallest balanced tree of height $h-2$ as right subtree

Height balanced trees

■ Minimum size height-balanced trees

- ## ■ General strategy to build a small balanced tree of height h
- Smallest balanced tree of height $h-1$ as left subtree
 - Smallest balanced tree of height $h-2$ as right subtree

Height balanced trees

■ Minimum size height-balanced trees

■ General strategy to build a small balanced tree of height h

- Smallest balanced tree of height $h-1$ as left subtree
- Smallest balanced tree of height $h-2$ as right subtree

■ $S(h)$, size of smallest height-balanced tree of height h

$$S(0) = 0$$

$$S(1) = 1$$

$$S(2) = 2$$

$$S(3) = 4$$

$$S(4) = 7$$

Want $S(h)$ to be exponential

Height balanced trees

- Minimum size height-balanced trees

- General strategy to build a small balanced tree of height h

- Smallest balanced tree of height $h-1$ as left subtree
- Smallest balanced tree of height $h-2$ as right subtree

- $S(h)$, size of smallest height-balanced tree of height h

- Recurrence

- $S(0) = 0, S(1) = 1$
- $S(h) = 1 + S(h-1) + S(h-2)$

Height balanced trees

■ Minimum size height-balanced trees

■ General strategy to build a small balanced tree of height h

- Smallest balanced tree of height $h-1$ as left subtree
- Smallest balanced tree of height $h-2$ as right subtree

■ $S(h)$, size of smallest height-balanced tree of height h

■ Recurrence

- $S(0) = 0, S(1) = 1$
- $S(h) = 1 + S(h-1) + S(h-2)$

■ Compare to Fibonacci sequence

- $F(0) = 0, F(1) = 1$
- $F(n) = F(n-1) + F(n-2)$

$$S(h) > F(h) \text{ for } h > 1$$

Height balanced trees

■ Minimum size height-balanced trees

- General strategy to build a small balanced tree of height h
 - Smallest balanced tree of height $h-1$ as left subtree
 - Smallest balanced tree of height $h-2$ as right subtree

- $S(h)$, size of smallest height-balanced tree of height h

■ Recurrence

- $S(0) = 0, S(1) = 1$
- $S(h) = 1 + S(h-1) + S(h-2)$

■ Compare to Fibonacci sequence

- $F(0) = 0, F(1) = 1$
- $F(n) = F(n-1) + F(n-2)$

- $S(h)$ grows exponentially with h

Height balanced trees

■ Minimum size height-balanced trees

- General strategy to build a small balanced tree of height h
 - Smallest balanced tree of height $h-1$ as left subtree
 - Smallest balanced tree of height $h-2$ as right subtree

- $S(h)$, size of smallest height-balanced tree of height h

■ Recurrence

- $S(0) = 0, S(1) = 1$
- $S(h) = 1 + S(h-1) + S(h-2)$

■ Compare to Fibonacci sequence

- $F(0) = 0, F(1) = 1$
- $F(n) = F(n-1) + F(n-2)$

- $S(h)$ grows exponentially with h

- For size n , h is $O(\log n)$

Correcting imbalance

- Slope of a node : `self.left.height() - self.right.height()`

Correcting imbalance

- **Slope** of a node : `self.left.height()` - `self.right.height()`
- Balanced tree — slope is $\{-1, 0, 1\}$

Correcting imbalance

- **Slope** of a node : `self.left.height() - self.right.height()`
- Balanced tree — slope is $\{-1, 0, 1\}$
- `t.insert(v)`, `t.delete(v)` can alter slope to -2 or $+2$

Correcting imbalance

- Slope of a node : `self.left.height() - self.right.height()`
- Balanced tree — slope is $\{-1, 0, 1\}$
- `t.insert(v)`, `t.delete(v)` can alter slope to -2 or $+2$

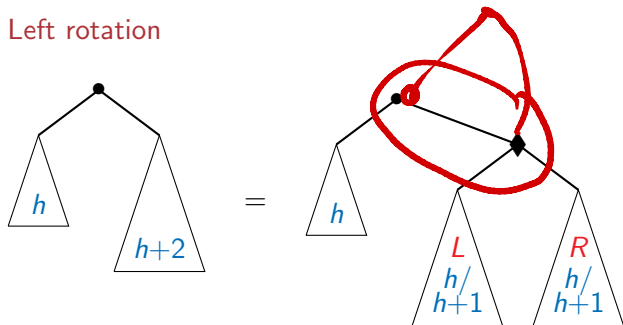

Left rotation

Correcting imbalance

- Slope of a node : `self.left.height() - self.right.height()`
- Balanced tree — slope is $\{-1, 0, 1\}$
- `t.insert(v)`, `t.delete(v)` can alter slope to -2 or $+2$

Left rotation

Correcting imbalance

- Slope of a node : `self.left.height() - self.right.height()`
- Balanced tree — slope is $\{-1, 0, 1\}$
- `t.insert(v)`, `t.delete(v)` can alter slope to -2 or $+2$

Left rotation — converts slope -2 to $\{0, 1, 2\}$

Correcting imbalance

- **Slope** of a node : `self.left.height() - self.right.height()`
- Balanced tree — slope is $\{-1, 0, 1\}$
- `t.insert(v)`, `t.delete(v)` can alter slope to -2 or $+2$

Right rotation

Correcting imbalance

- **Slope** of a node : `self.left.height() - self.right.height()`
- Balanced tree — slope is $\{-1, 0, 1\}$
- `t.insert(v)`, `t.delete(v)` can alter slope to -2 or $+2$

Right rotation

Correcting imbalance

- **Slope** of a node : `self.left.height() - self.right.height()`
- Balanced tree — slope is $\{-1, 0, 1\}$
- `t.insert(v)`, `t.delete(v)` can alter slope to -2 or $+2$

Right rotation — converts slope $+2$ to $\{-2, -1, 0\}$

Implementing rotations

```
class Tree:
```

```
...
```

```
def leftrotate(self):
```

```
    v = self.value
```

```
    vr = self.right.value
```

```
    tl = self.left
```

```
    trl = self.right.left
```

```
    trr = self.right.right
```

```
    newleft = Tree(v)
```

```
    newleft.left = tl
```

```
    newleft.right = trl
```

```
    self.value = vr
```

```
    self.left = newleft
```

```
    self.right = trr
```

```
    return
```

v | l | r

Implementing rotations

```
class Tree:
```

```
...
```

```
def rightrotate(self):
```

```
    v = self.value
```

```
    vl = self.left.value
```

```
    tll = self.left.left
```

```
    tlr = self.left.right
```

```
    tr = self.right
```

```
    newright = Tree(v)
```

```
    newright.left = tlr
```

```
    newright.right = tr
```

```
    self.value = vl
```

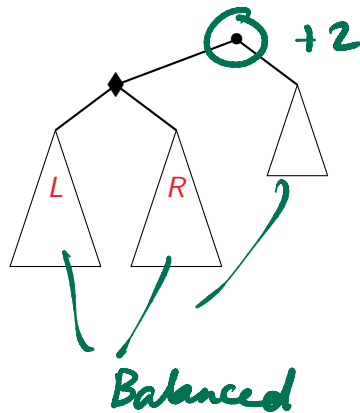

```
    self.left = tll
```

```
    self.right = newright
```

```
return
```

Rebalancing, root has slope +2

- Rebalance bottom-up, assume subtrees are balanced

Rebalancing, root has slope +2

- Rebalance bottom-up, assume subtrees are balanced
- Case 1: Slope at \blacklozenge is in $\{0, 1\}$

Rebalancing, root has slope +2

- Rebalance bottom-up, assume subtrees are balanced
- Case 1: Slope at \blacklozenge is in $\{0, 1\}$
 - Rotate right at \bullet
 - All nodes are balanced

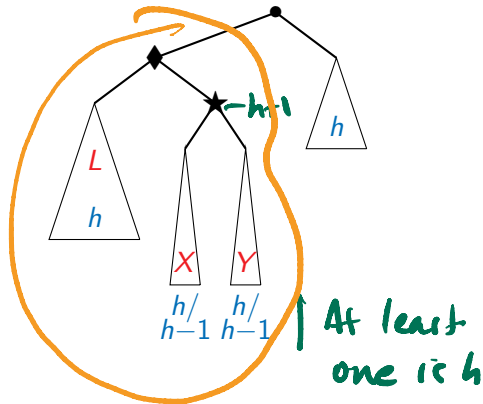

Rebalancing, root has slope +2

- Rebalance bottom-up, assume subtrees are balanced
- Case 1: Slope at \blacklozenge is in $\{0, 1\}$
 - Rotate right at \bullet
 - All nodes are balanced
- Case 2: Slope at \blacklozenge is -1

Rebalancing, root has slope +2

- Rebalance bottom-up, assume subtrees are balanced
- Case 1: Slope at \blacklozenge is in $\{0, 1\}$
 - Rotate right at \bullet
 - All nodes are balanced
- Case 2: Slope at \blacklozenge is -1
 - Expand R

Rebalancing, root has slope +2

- Rebalance bottom-up, assume subtrees are balanced
- Case 1: Slope at \blacklozenge is in $\{0, 1\}$
 - Rotate right at \bullet
 - All nodes are balanced
- Case 2: Slope at \blacklozenge is -1
 - Expand R
 - Rotate left at \blacklozenge

Rebalancing, root has slope +2

- Rebalance bottom-up, assume subtrees are balanced
- Case 1: Slope at \blacklozenge is in $\{0, 1\}$
 - Rotate right at \bullet
 - All nodes are balanced
- Case 2: Slope at \blacklozenge is -1
 - Expand R
 - Rotate left at \blacklozenge
 - Rotate left at \bullet

Rebalancing, root has slope +2

- Rebalance bottom-up, assume subtrees are balanced
- Case 1: Slope at \blacklozenge is in $\{0, 1\}$
 - Rotate right at \bullet
 - All nodes are balanced
- Case 2: Slope at \blacklozenge is -1
 - Expand R
 - Rotate left at \blacklozenge
 - Rotate left at \bullet
- Rebalance with root slope -2 is symmetric

Update insert() and delete()

- Use the rebalancing strategy to define a function `rebalance()`
- Rebalance each time the tree is modified
- Automatically rebalances bottom up

```
class Tree:
    ...
    def insert(self,v):
        if self.isempty():
            self.value = v
            self.left = Tree()
            self.right = Tree()

        if self.value == v:
            return

        if v < self.value:
            self.left.insert(v)
            self.left.rebalance()
            return

        if v > self.value:
            self.right.insert(v)
            self.right.rebalance()
            return
```

Update insert() and delete()

- Use the rebalancing strategy to define a function `rebalance()`
- Rebalance each time the tree is modified
- Automatically rebalances bottom up

```
class Tree:
    ...
    def delete(self,v):
        ...
        if v < self.value:
            self.left.delete(v)
            self.left.rebalance()
            return
        if v > self.value:
            self.right.delete(v)
            self.right.rebalance()
            return
        if v == self.value:
            if self.isleaf():
                self.makeempty()
            elif self.left.isempty():
                self.copyright()
            elif self.right.isempty():
                self.copyleft()
            else:
                self.value = self.left.maxval()
                self.left.delete(self.left.maxval())
        return
```

Computing slope

- To compute the slope we need heights of subtrees
- But, computing height is $O(n)$

```
class Tree:
    ...
    def height(self):
        if self.isempty():
            return(0)
        else:
            return(1 +
                    max(self.left.height(),
                       self.right.height()))
```

Computing slope

- To compute the slope we need heights of subtrees
- But, computing height is $O(n)$
- Instead, maintain a field `self.height`

```
class Tree:
    ...
    def height(self):
        if self.isempty():
            return(0)
        else:
            return(1 +
                    max(self.left.height(),
                       self.right.height()))
```

Computing slope

- To compute the slope we need heights of subtrees
- But, computing height is $O(n)$
- Instead, maintain a field `self.height`
- After each modification, update `self.height` based on `self.left.height`, `self.right.height`

```
class Tree:
    ...
    def insert(self,v):
        ...
        if v < self.value:
            self.left.insert(v)
            self.left.rebalance()
            self.height = 1 +
                max(self.left.height,
                    self.right.height)
            return

        if v > self.value:
            self.right.insert(v)
            self.right.rebalance()
            self.height = 1 +
                max(self.left.height,
                    self.right.height)
            return
```

Summary

- Using rotations, we can maintain height balance
- Height balanced trees have height $O(\log n)$
- `find()`, `insert()` and `delete()` all walk down a single path, take time $O(\log n)$

Red-Black tree
