Data Mining and Machine Learning
January–April 2023

D-Separation

- Check if $X \perp Y \mid Z$
- Dependence should be blocked on every trail from X to Y
 - Each undirected path from X to Y is a sequence of basic trails
 - For (a), (b), (c), need Z present
 - For (d), need Z absent
 - In general, V-structure includes descendants of the bottom node

- x and y are **D-separated** given z if all trails are blocked
- Variation of **breadth first search (BFS)** to check if y is reachable from x through some trail
- Extends to sets — each $x \in X$ is D-separated from each $y \in Y$

Markov blanket

- $MB(X)$ — Markov blanket of X

Markov blanket

- $MB(X)$ — Markov blanket of X
 - $Parents(X)$

Markov blanket

- $MB(X)$ — Markov blanket of X
 - $Parents(X)$
 - $Children(X)$

Markov blanket

- $MB(X)$ — Markov blanket of X
 - $Parents(X)$
 - $Children(X)$
 - $Parents\ of\ Children(X)$

Markov blanket

- $MB(X)$ — Markov blanket of X
 - $Parents(X)$
 - $Children(X)$
 - $Parents\ of\ Children(X)$
- $X \perp \neg MB(X) \mid MB(X)$

Computing with probabilistic graphical models

- John and Mary call Pearl. What is the probability that there has been a burglary?

Computing with probabilistic graphical models

- John and Mary call Pearl. What is the probability that there has been a burglary?
- Want $P(b | m, j)$

Computing with probabilistic graphical models

- John and Mary call Pearl. What is the probability that there has been a burglary?

- Want $P(b \mid m, j)$

- $$\frac{P(b, m, j)}{P(m, j)}$$

Computing with probabilistic graphical models

- John and Mary call Pearl. What is the probability that there has been a burglary?
- Want $P(b | m, j)$
- $\frac{P(b, m, j)}{P(m, j)}$
- Use chain rule to evaluate joint probabilities

Computing with probabilistic graphical models

- John and Mary call Pearl. What is the probability that there has been a burglary?
- Want $P(b | m, j)$
- $$\frac{P(b, m, j)}{P(m, j)}$$
- Use chain rule to evaluate joint probabilities
- Reorder variables appropriately, topological order of graph

Computing with probabilistic graphical models

$$\blacksquare P(m, j, b) = P(b) \sum_{e=0}^1 P(e) \sum_{a=0}^1 P(a | b, e) P(m | a) P(j | a)$$

J

m, j, b, e, a

m, j, b, e, a

m, j, b, e, a

m, j, b, e, a

Computing with probabilistic graphical models

- $P(m, j, b) = P(b) \sum_{e=0}^1 P(e) \sum_{a=0}^1 P(a | b, e) P(m | a) P(j | a)$
- Construct the computation tree

Computing with probabilistic graphical models

- $$P(m, j, b) = P(b) \sum_{e=0}^1 P(e) \sum_{a=0}^1 P(a | b, e) P(m | a) P(j | a)$$

- Construct the computation tree
- Use dynamic programming to avoid duplicated computations

Computing with probabilistic graphical models

- $$P(m, j, b) = P(b) \sum_{e=0}^1 P(e) \sum_{a=0}^1 P(a | b, e) P(m | a) P(j | a)$$

- Construct the computation tree
- Use dynamic programming to avoid duplicated computations
- However, **exact inference** is NP-complete, in general

Computing with probabilistic graphical models

- $$P(m, j, b) = P(b) \sum_{e=0}^1 P(e) \sum_{a=0}^1 P(a | b, e) P(m | a) P(j | a)$$

- Construct the computation tree
- Use dynamic programming to avoid duplicated computations
- However, **exact inference** is NP-complete, in general
- Instead, **approximate inference** through sampling

Approximate inference

- Generate random samples (b, e, a, m, j) , count to estimate probabilities

Approximate inference

- Generate random samples (b, e, a, m, j) , count to estimate probabilities
- Random samples should respect conditional probabilities

Approximate inference

- Generate random samples (b, e, a, m, j) , count to estimate probabilities
- Random samples should respect conditional probabilities
- Fix parents of x before generating x

Approximate inference

- Generate random samples (b, e, a, m, j) , count to estimate probabilities
- Random samples should respect conditional probabilities
- Fix parents of x before generating x
- Generate in topological order
 - Generate b, e with probabilities $P(b)$ and $P(e)$
 - Generate a with probability $P(a | b, e)$
 - Generate j, m with probabilities $P(j | a)$, $P(m | a)$

$$P(b|j,m)$$

$$\frac{P(b|j,m)}{P(j,m)}$$

Approximate inference

- We are interested in $P(b | j, m)$

Approximate inference

- We are interested in $P(b | j, m)$
- Samples with $\neg j$ or $\neg m$ are useless

Approximate inference

- We are interested in $P(b | j, m)$
- Samples with $\neg j$ or $\neg m$ are useless
- Can we sample more efficiently?

Rejection sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$

Rejection sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Topological order
 - Generate *Cloudy*
 - Generate *Sprinkler*, *Rain*
 - Generate *Wet Grass*

Rejection sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Topological order L Assumed
 - Generate *Cloudy*
 - Generate *Sprinkler*, *Rain*
 - Generate *Wet Grass*
- If we start with $\neg \text{Cloudy}$, sample is useless

Rejection sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Topological order
 - Generate *Cloudy*
 - Generate *Sprinkler*, *Rain*
 - Generate *Wet Grass*
- If we start with $\neg \text{Cloudy}$, sample is useless
- Immediately stop and reject this sample — **rejection sampling**

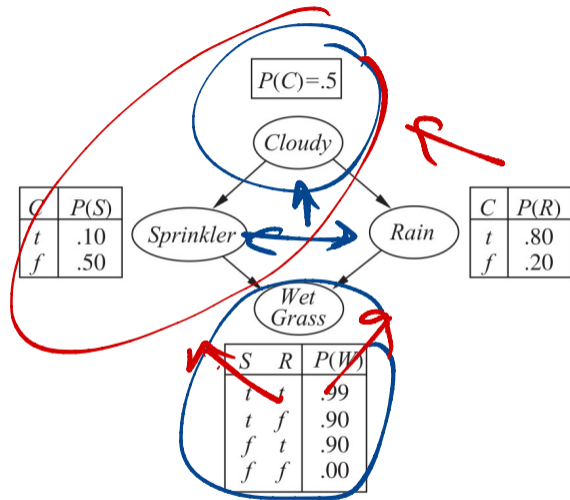

Rejection sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Topological order
 - Generate *Cloudy*
 - Generate *Sprinkler*, *Rain*
 - Generate *Wet Grass*
- If we start with $\neg \text{Cloudy}$, sample is useless
- Immediately stop and reject this sample — **rejection sampling**
- General problem with low probability situation — many samples are rejected

Likelihood weighted sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$

Likelihood weighted sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Fix **evidence** *Cloudy, Wet Grass* true

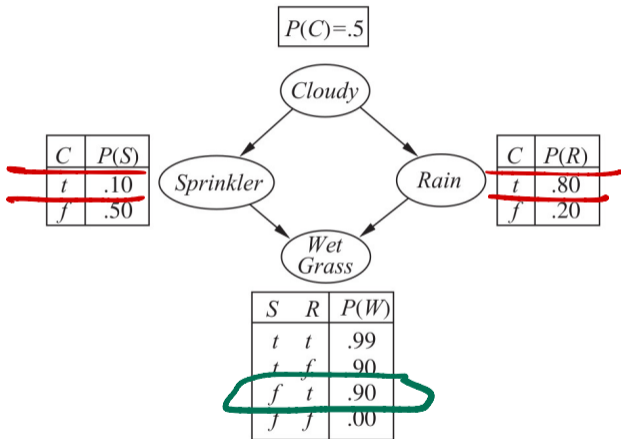

Likelihood weighted sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Fix **evidence** *Cloudy*, *Wet Grass* true
- Then generate the other variables

Likelihood weighted sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Fix **evidence** *Cloudy, Wet Grass* true
- Then generate the other variables
- Suppose we generate $c, \neg s, r, w$

Likelihood weighted sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Fix **evidence** $\text{Cloudy}, \text{Wet Grass}$ true
- Then generate the other variables
- Suppose we generate $c, \neg s, r, w$
- Compute likelihood of evidence:
 $0.5 \times 0.9 = 0.45$

$$P(C) \quad P(W \mid \neg S, R)$$

Likelihood weighted sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Fix **evidence** *Cloudy, Wet Grass* true
- Then generate the other variables
- Suppose we generate $c, \neg s, r, w$
- Compute likelihood of evidence:
 $0.5 \times 0.9 = 0.45$
- 0.45 is **likelihood weight** of sample

Likelihood weighted sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Fix **evidence** *Cloudy, Wet Grass* true
- Then generate the other variables
- Suppose we generate $c, \neg s, r, w$
- Compute likelihood of evidence:
 $0.5 \times 0.9 = 0.45$
- 0.45 is **likelihood weight** of sample
- Samples s_1, s_2, \dots, s_N with weights
 w_1, w_2, \dots, w_N

Likelihood weighted sampling

- $P(\text{Rain} \mid \text{Cloudy}, \text{Wet Grass})$
- Fix **evidence** *Cloudy*, *Wet Grass* true
- Then generate the other variables
- Suppose we generate $c, \neg s, r, w$
- Compute likelihood of evidence:
 $0.5 \times 0.9 = 0.45$
- 0.45 is **likelihood weight** of sample
- Samples s_1, s_2, \dots, s_N with weights w_1, w_2, \dots, w_N

$$\blacksquare P(r \mid c, w) = \frac{\sum_{s_i \text{ has rain}} w_i}{\sum_{1 \leq j \leq N} w_j}$$

Approximate inference using Markov chains

Markov chains

- Finite set of states, with transition probabilities between states

Approximate inference using Markov chains

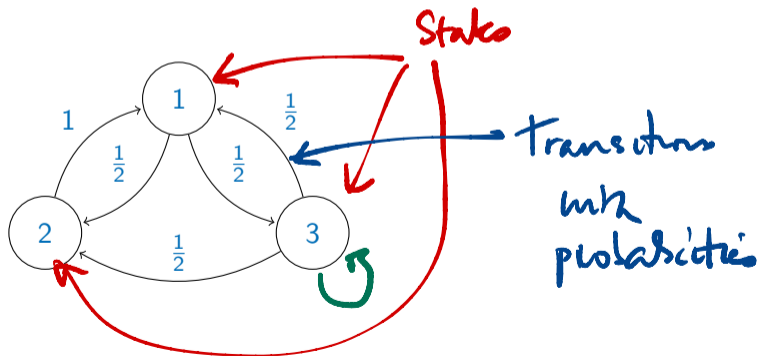

Markov chains

- Finite set of states, with transition probabilities between states
- For us, a state will be an assignment of values to variables

Approximate inference using Markov chains

Markov chains

- Finite set of states, with transition probabilities between states
- For us, a state will be an assignment of values to variables
- A three state Markov Chain

Approximate inference using Markov chains

Markov chains

- Finite set of states, with transition probabilities between states
- For us, a state will be an assignment of values to variables
- A three state Markov Chain

- Represent using a **transition matrix** — stochastic

$$A = \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix}$$

↓
each row
sums to 1

Approximate inference using Markov chains

Markov chains

- Finite set of states, with transition probabilities between states
- For us, a state will be an assignment of values to variables
- A three state Markov Chain

- Represent using a **transition matrix** — stochastic

$$A = \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix}$$

- $P[j]$ is probability of being in state j

Approximate inference using Markov chains

Markov chains

- Finite set of states, with transition probabilities between states
- For us, a state will be an assignment of values to variables
- A three state Markov Chain

- Represent using a **transition matrix** — stochastic

$$A = \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix}$$

- $P[j]$ is probability of being in state j

- Start in state 1, so initially $P = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$

$$\begin{bmatrix} 0 \\ 1/2 \\ 1/2 \end{bmatrix}$$

Markov chains ...

- After one step:

$$P^T A = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} = \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \end{bmatrix}$$

Markov chains ...

- After one step:

$$P^T A = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} = \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \end{bmatrix}$$

- After second step:

$$\begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \end{bmatrix} \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} = \begin{bmatrix} \frac{3}{4} & \frac{1}{4} & 0 \end{bmatrix}$$

Markov chains ...

- After one step:

$$P^T A = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} = \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \end{bmatrix}$$

- After second step:

$$\begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \end{bmatrix} \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} = \begin{bmatrix} \frac{3}{4} & \frac{1}{4} & 0 \end{bmatrix}$$

- After k steps, $P[j]$ is probability of being in state j

Markov chains ...

- After one step:

$$P^T A = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} = \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \end{bmatrix}$$

- After second step:

$$\begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \end{bmatrix} \begin{bmatrix} 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix} = \begin{bmatrix} \frac{3}{4} & \frac{1}{4} & 0 \end{bmatrix}$$

- After k steps, $P[j]$ is probability of being in state j
- Continuing our example,

$$\begin{bmatrix} \frac{3}{4} & \frac{1}{4} & 0 \end{bmatrix} \rightarrow \begin{bmatrix} \frac{1}{4} & \frac{3}{8} & \frac{3}{8} \end{bmatrix} \rightarrow \begin{bmatrix} \frac{9}{16} & \frac{5}{16} & \frac{1}{8} \end{bmatrix}$$

Ergodicity

- Is it the case that $P[j] > 0$ for all j continuously, after some point?

Ergodicity

- Is it the case that $P[j] > 0$ for all j continuously, after some point?
- Markov chain A is **ergodic** if there is some t_0 such that for every P , for all $t > t_0$, for every j , $(P^\top A^t)[j] > 0$.

Ergodicity

- Is it the case that $P[j] > 0$ for all j continuously, after some point?
- Markov chain A is **ergodic** if there is some t_0 such that for every P , for all $t > t_0$, for every j , $(P^T A^t)[j] > 0$.
 - No matter where we start, after $t > t_0$ steps, every state has a nonzero probability of being visited in step t

Ergodicity

- Is it the case that $P[j] > 0$ for all j continuously, after some point?
- Markov chain A is **ergodic** if there is some t_0 such that for every P , for all $t > t_0$, for every j , $(P^\top A^t)[j] > 0$.
 - No matter where we start, after $t > t_0$ steps, every state has a nonzero probability of being visited in step t
- Properties of ergodic Markov chains
 - There is a stationary distribution π^* , $(\pi^*)^\top A = \pi^*$
 - π^* is a **left eigenvector** of A

Ergodicity

- Is it the case that $P[j] > 0$ for all j continuously, after some point?
- Markov chain A is **ergodic** if there is some t_0 such that for every P , for all $t > t_0$, for every j , $(P^\top A^t)[j] > 0$.
 - No matter where we start, after $t > t_0$ steps, every state has a nonzero probability of being visited in step t
- Properties of ergodic Markov chains
 - There is a stationary distribution π^* , $(\pi^*)^\top A = \pi^*$
 - π^* is a **left eigenvector** of A
 - For *any* starting distribution P , $\lim_{t \rightarrow \infty} P^\top A^t = \pi^*$

Ergodicity ...

- How can ergodicity fail?

- How can ergodicity fail?
 - Starting from i , we reach a set of states from which there is no path back to i

Ergodicity ...

- How can ergodicity fail?
 - Starting from i , we reach a set of states from which there is no path back to i
 - We have a cycle $i \rightarrow j \rightarrow k \rightarrow i \rightarrow j \rightarrow k \dots$, so we can only visit some states periodically

$$100 \rightarrow 0\frac{1}{2} \frac{1}{2} \rightarrow 0\frac{1}{2} \frac{1}{2}$$

Ergodicity ...

- How can ergodicity fail?
 - Starting from i , we reach a set of states from which there is no path back to i
 - We have a cycle $i \rightarrow j \rightarrow k \rightarrow i \rightarrow j \rightarrow k \dots$, so we can only visit some states periodically
- Sufficient conditions for ergodicity

Ergodicity ...

- How can ergodicity fail?
 - Starting from i , we reach a set of states from which there is no path back to i
 - We have a cycle $i \rightarrow j \rightarrow k \rightarrow i \rightarrow j \rightarrow k \dots$, so we can only visit some states periodically
- Sufficient conditions for ergodicity
 - **Irreducibility**: When viewed as a directed graph, A is strongly connected
 - For all states i, j , there is a path from i to j and a path from j to i

- How can ergodicity fail?
 - Starting from i , we reach a set of states from which there is no path back to i
 - We have a cycle $i \rightarrow j \rightarrow k \rightarrow i \rightarrow j \rightarrow k \dots$, so we can only visit some states periodically
- Sufficient conditions for ergodicity
 - **Irreducibility**: When viewed as a directed graph, A is strongly connected
 - For all states i, j , there is a path from i to j and a path from j to i
 - **Aperiodicity**: For any pair of vertices i, j , the gcd of the lengths of all paths from i to j is 1
 - In particular, paths (loops) from i to i do not all have lengths that are multiples of some $k \geq 2$ — prevents bad cycles

- Can efficiently approximate $\lim_{t \rightarrow \infty} P^T A^t$
by repeated squaring: $P^T A^2, P^T A^4,$
 $P^T A^8, \dots, P^T A^{2^k}, \dots$
 - **Mixing time** — how fast this converges to π^*

- Can efficiently approximate $\lim_{t \rightarrow \infty} P^T A^t$ by repeated squaring: $P^T A^2$, $P^T A^4$, $P^T A^8$, ..., $P^T A^{2^k}$, ...
 - **Mixing time** — how fast this converges to π^*
- Stationary distribution represents fraction of visits to each state in a long enough execution

- Can efficiently approximate $\lim_{t \rightarrow \infty} P^T A^t$ by repeated squaring: $P^T A^2$, $P^T A^4$, $P^T A^8$, ..., $P^T A^{2^k}$, ...
 - **Mixing time** — how fast this converges to π^*
- Stationary distribution represents fraction of visits to each state in a long enough execution
- Can we create a Markov chain from a Bayesian network so that the stationary distribution is meaningful?

Approximate inference using Markov chains

- Bayesian network has variables

v_1, v_2, \dots, v_n

Approximate inference using Markov chains

- Bayesian network has variables v_1, v_2, \dots, v_n
- Each assignment of values to the variables is a state

Approximate inference using Markov chains

- Bayesian network has variables v_1, v_2, \dots, v_n
- Each assignment of values to the variables is a state
- Set up a Markov chain based on these states

Approximate inference using Markov chains

- Bayesian network has variables v_1, v_2, \dots, v_n
- Each assignment of values to the variables is a state
- Set up a Markov chain based on these states
- Stationary distribution should assign to state s the probability $P(s)$ in the Bayesian network

Approximate inference using Markov chains

- Bayesian network has variables v_1, v_2, \dots, v_n
- Each assignment of values to the variables is a state
- Set up a Markov chain based on these states
- Stationary distribution should assign to state s the probability $P(s)$ in the Bayesian network
- How to reverse engineer the transition probabilities to achieve this?
