76766	Crick	Biology	72000
83821	Brandt	Brandt Comp. Sci.	
98345	Kim	Elec. Eng.	80000

#### Variety of datatypes

- varchar(n) varying length character string with upper bound
- numeric(p,d) fixed precision float, p digits, d after decimal point

```
create table instructor
  (ID varchar(5),
   name varchar(20).
   dept_name varchar(20),
   salary numeric(8,2)
```

ID	name	dept_name	salary	
10101	Srinivasan	Comp. Sci.	65000	
12121	Wu	Finance	90000	
15151	Mozart	Music	40000	
22222	Einstein	Physics	95000	
32343	El Said	History	60000	
33456	Gold	Physics	87000	
45565	Katz	Comp. Sci.	75000	
58583	Califieri	History	62000	
76543	Singh	Finance	80000	
76766	Crick	Biology	72000	
83821	Brandt	Comp. Sci.	92000	
98345	Kim	Elec. Eng.	80000	

Add constraints on values

ID	name	dept_name	salary
10101	Srinivasan	Comp. Sci.	65000
12121	Wu	Finance	90000
15151	Mozart	Music	40000
22222	Einstein	Physics	95000
32343	El Said	l Said History	
33456	Gold	fold Physics	
45565	Katz	Comp. Sci.	75000
58583	Califieri	History	62000
76543	Singh	Finance	80000
76766	Crick	Biology	72000
83821	Brandt	andt Comp. Sci.	
98345	Kim	Elec. Eng.	80000

- Add constraints on values
  - Force non-null name
  - Minimum amount for salary

create table instructor (ID varchar(5), - Implicitly not name varchar(20) not null. WW dept\_name varchar(20), salary numeric(8,2) check (salary > 29000)

	ID	name	dept_name	salary
	10101	Srinivasan	Comp. Sci.	65000
	12121	Wu	Finance	90000
	15151	Mozart	Music	40000
	22222	Einstein	Physics	95000
V	32343	456 Gold	History Physics Comp. Sci. History	60000
Ī	33456			87000
	45565			75000

#### teaches

#### Add a row to a table

ID	name	ame dept_name	
10101	Srinivasan	Comp. Sci.	65000
12121	Wu	Finance	90000
15151	Mozart	Music	40000
22222	Einstein	Physics	95000
32343	El Said	History	60000
33456	Gold	Physics	87000
45565	Katz	Comp. Sci.	75000
58583	Califieri	History	62000
76543	Singh	Finance	80000
76766	Crick	Biology	72000
83821	Brandt	Comp. Sci.	92000
98345	Kim	Elec. Eng.	80000

Add a row to a table

 Without needing to remember column order

```
insert into instructor
     (name, id, salary, dept_name)
    values
     ('Wu','12121','90000','Finance');
```

ID	name	dept_name	salary
10101	Srinivasan	Comp. Sci.	65000
12121	Wu	Finance	90000
15151	Mozart	Music	40000
22222	Einstein	Physics	95000
32343	El Said	History	60000
33456	Gold	Physics	87000
45565	Katz	Comp. Sci.	75000
58583	Califieri	History	62000
76543	Singh	Finance	80000
76766	Crick	Biology	72000
83821	Brandt	Comp. Sci.	92000
98345	Kim	Elec. Eng.	80000

Add a row to a table

```
insert into instructor values 0.01010, 'Srinivasan', 'Comp. Sci.', 0.5000;
```

Without needing to remember column order

```
insert into instructor
          (name, id) salary, dept_name)
    values
          ('Wu','12121','90000','Finance');
```

Note the quotation marks

14 / 19

#### **Null Values**

- It is possible for tuples to have a null value, denoted by null, for some of their attributes
- null signifies an unknown value or that a value does not exist.
- The result of any arithmetic expression involving null is null
  - Example: 5 + null returns null
- The predicate is null can be used to check for null values.
  - · Example: Find all instructors whose salary is null.

select name from instructor where salary is null

 The predicate is not null succeeds if the value on which it is applied is not null.

## **Null Values (Cont.)**

- SQL treats as unknown the result of any comparison involving a null value (other than predicates is null and is not null).
  - Example: 5 < null or null <> null or null = null
- The predicate in a where clause can involve Boolean operations (and, or, not); thus the definitions of the Boolean operations need to be extended to deal with the value unknown.
  - and: (true and unknown) = unknown, (false and unknown) = false, (unknown and unknown) = unknown
  - or: (unknown or true) = true, (unknown or false) = unknown (unknown or unknown) = unknown
- Result of where clause predicate is treated as false if it evaluates to unknown

#### Joins in SQL

■ Join — cartesian product combined with selection

15 / 19

## Joins in SQL

- Join cartesian product combined with selection
- Three specific types of join
  - Natural join ✓

  - Outer join
    Inner join
    7

15 / 19

- Match tuples with the same values for all common attributes
- Retain only one copy of each common column.

  Duplicate wil removed

- Match tuples with the same values for all common attributes
- Retain only one copy of each common column.
- List the names of instructors along with the course ID of the courses that they taught

```
select name, course_id
  from students, takes
  where student.ID = takes.ID;
```

- Match tuples with the same values for all common attributes
- Retain only one copy of each common column.
- List the names of instructors along with the course ID of the courses that they taught

```
from students, takes

where student.ID = takes.ID;
```

■ Same query in SQL with natural join

```
select name, course_id
from student natural join takes;
```

- Match tuples with the same values for all common attributes
- Retain only one copy of each common column.
- List the names of instructors along with the course ID of the courses that they taught

```
select name, course_id
from students, takes
  where student.ID = takes.ID;
```

Same query in SQL with natural join select name, course\_id from student natural join takes;

Can join multiple relations at a time

#### **Student Relation**

## **Dangerous in Natural Join**

- Beware of unrelated attributes with same name which get equated incorrectly
- Example -- List the names of students instructors along with the titles of courses that they have taken
  - Correct version

select name, title
from student natural join takes, course
where takes.course\_id = course.course\_id;

Incorrect version

rect version
select name, title

Course - 1 d

from student natural join takes natural join course;

- This query omits all (student name, course title) pairs where the student takes a course in a department other than the student's own department.
- The correct version (above), correctly outputs such pairs.

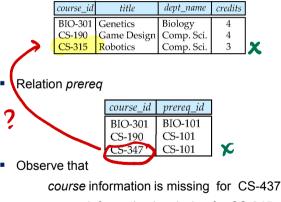

#### **Outer Join**

- An extension of the join operation that avoids loss of information.
- Computes the join and then adds tuples form one relation that does not match tuples in the other relation to the result of the join.
- Uses null values.
- Three forms of outer join:
  - left outer join
  - right outer join
  - full outer join

## **Outer Join Examples**

Relation course

Natural join Course-id

prereg information is missing for CS-315

#### **Left Outer Join**

course natural left outer join prereq

course_id	title	dept_name	credits	prereq_id
BIO-301	Genetics	Biology	4	BIO-101
CS-190	Game Design			CS-101
CS-315	Robotics	Comp. Sci.	3	null

■ In relational algebra: course ▶ prereg

## **Right Outer Join**

course natural right outer join prereq

	course_id	title	dept_name	credits	prereq_id
		PORT AND AND ARRANGED TO THE PARTY.	Biology	10	BIO-101
ı	CS-190	Game Design	Comp. Sci.	4	CS-101
ı	CS-347	null	null	null	CS-101

#### **Full Outer Join**

course natural full outer join prereq

course_id	title	dept_name	credits	prereq_id
BIO-301		Biology	4	BIO-101
CS-190 CS-315	Game Design Robotics	Comp. Sci.	(0)	CS-101 null
CS-347	null	null		CS-101

■ In relational algebra: course ➤ prereg

Use care

# Counting votes in electron

( Alba	Votes		
Candidates  10   Name	DI Hoch	Votes	w zero
XAS	-		Aggs com

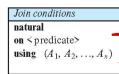

left outer jonn to register Zero votes for XY2

## **Joined Types and Conditions**

- Join operations take two relations and return as a result another relation.
- These additional operations are typically used as subquery expressions in the from clause
- Join condition defines which tuples in the two relations match, and what attributes are present in the result of the join.
- Join type defines how tuples in each relation that do not match any tuple in the other relation (based on the join condition) are treated.

Join types
inner join
left outer join
right outer join
full outer join

instead of where

## Joined Relations – Examples

course natural right outer join prereq

course_id	title	dept_name	credits	prereq_id
BIO-301	Genetics	Biology	4	BIO-101
CS-190	Game Design	Comp. Sci.	4	CS-101
CS-347	null	null	null	CS-101

course full outer join prereq using (course\_id)

means natural

dept name credits prereq\_id course id title BIO-301 Genetics BIO-101 Biology CS-190 Game Design Comp. Sci. 4 CS-101 CS-315 Robotics Comp. Sci. null CS-347 null null null CS-101

## Joined Relations – Examples

course inner join prereq on course.course\_id = prereq.course\_id

co <mark>ur</mark> se_id	title	dept_name	credits	prereq_id	course_id
BIO-301	Genetics	Biology		BIO-101	BIO-301
CS-190	Game Design	Comp. Sci.		CS-101	CS-190

- What is the difference between the above, and a natural join?
- course left outer join prereq on course.course\_id = prereq.course\_id

course_id	title	dept_name	credits	prereq_id	course_id
	Genetics Game Design	Biology			BIO-301 CS-190
CS-190 CS-315		Comp. Sci.		null	null

## Views in SQL

Views are virtual tables

Tables are distributed
Often need aggregated information — query

## Views in SQL

- Views are virtual tables
- Hide sensitive information from some users hide salary

```
select ID, name, dept_name
from instructor
```

## Views in SQL

- Views are virtual tables
- Hide sensitive information from some users hide salary

```
select ID, name, dept_name
from instructor
```

Create convenient "intermediate tables"

```
select instructor.name, course.title
from instructor,course natural join teaches
```

#### **View Definition**

 A view is defined using the create view statement which has the form

create view v as < query expression >

where <query expression> is any legal SQL expression. The view name is represented by v.

- Once a view is defined, the view name can be used to refer to the virtual relation that the view generates.
- View definition is not the same as creating a new relation by evaluating the query expression
  - Rather, a view definition causes the saving of an expression; the expression is substituted into queries using the view.

#### **View Definition and Use**

A view of instructors without their salary

create view faculty as
 select ID, name, dept\_name
 from instructor

Find all instructors in the Biology department

select name from faculty where dept\_name = 'Biology'

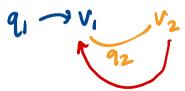

Create a view of department salary totals

create view departments\_total\_salary(dept\_name, total\_salary) as
 select dept\_name, sum (salary)
 from instructor
 group by dept\_name;

# **Views Defined Using Other Views**

- One view may be used in the expression defining another view
- A view relation v<sub>1</sub> is said to depend directly on a view relation v<sub>2</sub> if v<sub>2</sub> is used in the expression defining v<sub>1</sub>
- A view relation v<sub>1</sub> is said to depend on view relation v<sub>2</sub> if either v<sub>1</sub> depends directly to v<sub>2</sub> or there is a path of dependencies from v<sub>1</sub> to v<sub>2</sub>
- A view relation v is said to be recursive if it depends on itself.

# **Views Defined Using Other Views**

create view physics\_fall\_2017 as
 select course.course\_id, sec\_id, building, room\_number
 from course, section
 where course.course\_id = section.course\_id
 and course.dept\_name = 'Physics'
 and section.semester = 'Fall'
 and section.year = '2017';

 create view physics\_fall\_2017\_watson as select course\_id, room\_number from physics\_fall\_2017 where building= 'Watson';

## **View Expansion**

Expand the view :

```
create view physics_fall_2017_watson as
select course_id, room_number
from physics_fall_2017
where building= 'Watson'
```

To:

```
create view physics_fall_2017_watson as
select course_id, room_number
from (select course.course_id, building, room_number
from course, section
where course.course_id = section.course_id
and course.dept_name = 'Physics'
and section.semester = 'Fall'
and section.year = '2017')
where building= 'Watson';
```

# **View Expansion (Cont.)**

- A way to define the meaning of views defined in terms of other views.
- Let view v<sub>1</sub> be defined by an expression e<sub>1</sub> that may itself contain uses of view relations.
- View expansion of an expression repeats the following replacement step:

#### repeat

Find any view relation  $v_i$  in  $e_1$ Replace the view relation  $v_i$  by the expression defining  $v_i$ **until** no more view relations are present in  $e_1$ 

 As long as the view definitions are not recursive, this loop will terminate

#### **Materialized Views**

- Certain database systems allow view relations to be physically stored.
  - Physical copy created when the view is defined.
  - Such views are called Materialized view:
- If relations used in the query are updated, the materialized view result becomes out of date
  - Need to maintain the view, by updating the view whenever the underlying relations are updated.

## **Update of a View**

 Add a new tuple to faculty view which we defined earlier insert into faculty

values ('30765', 'Green', 'Music');

- This insertion must be represented by the insertion into the instructor relation
  - Must have a value for salary.
- Two approaches
  - Reject the insert
  - Inset the tuple

('30765', 'Green', 'Music', null)

into the instructor relation

## Some Updates Cannot be Translated Uniquely

- create view instructor\_info as select ID, name, building from instructor, department where instructor.dept\_name= department.dept\_name;
- insert into instructor\_info values ('69987', 'White', 'Taylor');
- Issues
  - Which department, if multiple departments in Taylor?
  - What if no department is in Taylor?

#### And Some Not at All

- create view history\_instructors as select \* from instructor where dept\_name= 'History';
- What happens if we insert ('25566', 'Brown', 'Biology', 100000) into history\_instructors?

## **Built-in Data Types in SQL**

date: Dates, containing a (4 digit) year, month and date

• Example: date '2005-7-27'

• time: Time of day, in hours, minutes and seconds.

Example: time '09:00:30'
 time '09:00:30.75'

timestamp: date plus time of day

Example: timestamp '2005-7-27 09:00:30.75'

interval: period of time

Example: interval '1' day

Subtracting a date/time/timestamp value from another gives an interval value

Interval values can be added to date/time/timestamp values

#### Advanced SQL

- Many other features
  - Transactions
  - Assertions and triggers
  - . . . .

#### Advanced SQL

- Many other features
  - Transactions
  - Assertions and triggers
  - . . . .
- Can call SQL from other programming languages
  - Almost every language has library functions to invoke SQL
  - Transfer data between online forms and databases
  - . . . .

#### Security — SQL injection attacks

- User input can be malicious commands to corrupt database
- Always validate data entered in a form before passing on to SQL

## Security — SQL injection attacks

- User input can be malicious commands to corrupt database
- Always validate data entered in a form before passing on to SQL
