NPTEL MOOC

PROGRAMMING, DATA STRUCTURES AND ALGORITHMS IN PYTHON

Week 3, Lecture 2

Madhavan Mukund, Chennai Mathematical Institute http://www.cmi.ac.in/~madhavan

Lists

- * Lists are mutable
 - * list1 = [1,3,5,6] list2 = list1 list1[2] = 7
 - * list1 is now [1,3,7,6]
 - * So is list2

Lists

* On the other hand

```
* list1 = [1,3,5,6]
list2 = list1
list1 = list1[0:2] + [7] + list1[3:]
```

- * list1 is now [1,3,7,6]
- * list2 remains [1,3,5,6]
- * Concatenation produces a new list

Extending a list

- * Adding an element to a list, in place
 - * list1 = [1,3,5,6]
 list2 = list1
 list1.append(12)
 - * list1 is now [1,3,5,6,12]
 - * list2 is also [1,3,5,6,12]

Extending a list ...

* On the other hand

```
* list1 = [1,3,5,6]
list2 = list1
list1 = list1 + [12]
```

- * list1 is now [1,3,5,6,12]
- * list2 remains [1,3,5,6]
- * Concatenation produces a new list

List functions

- * list1.append(v) extend list1 by a single value v
- * list1.extend(list2) extend list1 by a list of values
 - * In place equivalent of list1 = list1 + list2
- * list1.remove(x) removes first occurrence of x
 - * Error if no copy of x exists in list1

A note on syntax

- * list1.append(x) rather than append(list1,x)
 - * list1 is an object
 - * append() is a function to update the object
 - * x is an argument to the function
- * Will return to this point later

Further list manipulation

- * Can also assign to a slice in place
 - * list1 = [1,3,5,6] list2 = list1 list1[2:] = [7,8]
 - * list1 and list2 are both [1,3,7,8]
- * Can expand/shrink slices, but be sure you know what you are doing!
 - * list1[2:] = [9,10,11] produces [1,3,9,10,11]
 - * list1[0:2] = [7] produces [7,9,10,11]

List membership

* x in l returns True if value x is found in list l

Safely remove x from l
 if x in l:
 l.remove(x)

Remove all occurrences of x from l
 while x in l:
 l.remove(x)

Other functions

- * l.reverse() reverse l in place
- * l.sort() sort l in ascending order
- * l.index(x) find leftmost position of x in l
 - * Avoid error by checking if x in 1
- * l.rindex(x) find rightmost position of x in l
- * Many more ... see Python documentation!

Initialising names

* A name cannot be used before it is assigned a value

$$y = x + 1 \# Error if x is unassigned$$

- * May forget this for lists where update is implicitl.append(v)
- * Python needs to know that 1 is a list

Initialising names ...

```
def factors(n):
    for i in range(1,n+1):
        if n%i == 0:
            flist.append(i)
    return(flist)
```

Initialising names ...

```
def factors(n):
    flist = []
    for i in range(1,n+1):
        if n%i == 0:
            flist.append(i)
    return(flist)
```

Summary

- * To extend lists in place, use l.append(),
 l.extend()
 - * Can also assign new value, in place, to a slice
- Many built in functions for lists see documentation
- * Don't forget to assign a value to a name before it is first used
