**Hint: Think prime numbers!**

**Answer ?**

**Towards the end of the talk :)**

- Rule to form a new line ?
- Number of elements in the  $i^{th}$  line ?

# BIPARTITE GRAPHS OF SMALL READABILITY

# Bipartite Graphs and Strings

Assign strings to vertices of the bipartite graph

- edges  $\Rightarrow$  overlapping strings
- nonedges  $\Rightarrow$  nonoverlapping strings

# Readability

- Parameter of bipartite graphs  
[Chikhi Medvedev Milanič Raskhodnikova '16]
- Captures the assignment of strings to vertices such that string overlaps represent vertex adjacencies
- Arises from the study of overlap graphs in bioinformatics
  - Overlap digraphs (de Bruijn graphs, string graphs) of DNA strings have several applications in the context of genome assembly

# Readability: Definition

No restriction on  
alphabet

- **Overlapping strings:** Nonempty suffix of first string equals a prefix of second string
- **Overlap labeling:** Assignment of strings to vertices:
  - An **edge** corresponds to **overlapping strings**
  - A **non-edge (across the bipartition)** corresponds to **nonoverlapping** strings
- **Length of an overlap labeling:** Maximum over lengths of all strings in the labeling

**Readability : Min. over lengths of all overlap labelings**

# Overlap labeling : Examples

Overlap Labeling

Optimal Overlap Labeling

Readability is 2

# Complexity of Computing Readability

Is the following problem in NP?

Given graph  $G$  and integer  $k$ , does  $G$  have readability at most  $k$ ?

**Trivial for  $k = 1$ ;  $G$  has readability 1 iff  $G$  is a disjoint union of bicliques (complete bipartite graphs).**

# Our Results 1: Readability 2 Algorithm

**Polynomial-time algorithm to decide whether a graph  $G$  has readability at most 2**

$G$  has readability at most 2  $\Rightarrow$  Algorithm produces an overlap labeling of length at most 2.

**Key idea:** We characterize bipartite graphs of readability at most 2 as having a matching with particular properties.

# Readability Bounds

- Readability of a graph  $G$  is at most  $2^{\Delta+1}$ , where  $\Delta$  is the maximum degree of  $G$  [Braga Meidanis'02, Chikhi Medvedev Milanič Raskhodnikova '16]
- Readability of almost all bipartite graphs (on  $n$  vertices in each part) is  $\Omega(n / \log n)$  [CMMR'16]
- Explicit graph family (on  $n$  vertices in each part) with readability  $\Omega(n)$  [CMMR'16]

What graph families have small readability?

# Our Results 2: Graph Families with Small Readability

Graph Family	Upper Bound	Lower Bound
Bipartite chain graphs	$O(\sqrt{n})$	$\Omega(\log n)$
Grids and grid graphs	3	3

Bipartite Chain Graph

4 × 4 Grid

A Grid Graph

# Today: Readability of Bipartite Chain Graphs

Bipartite Chain Graph  $\mathcal{C}_{n,n}$

$$\forall i \in [n] \quad N(a_i) = \{b_i, b_{i+1}, \dots, b_n\}$$

Readability of  $\mathcal{C}_{n,n}$  is  $O(\sqrt{n})$   
using labels of 3 characters.

# Forward-Matching Sequences

Bipartite Chain Graph  $\mathcal{C}_{n,n}$

Sequence of strings  $s_1, s_2, \dots, s_n$  such that:

- $s_i$  overlaps  $s_j$  iff  $i < j$

Overlap Labeling for  $\mathcal{C}_{n,n}$

For all  $r$ , forward-matching sequence of  $\Omega(r^2)$  strings each of length at most  $r$

Readability of  $\mathcal{C}_{n,n}$  is  $O(\sqrt{n})$

# Constructing Forward-Matching Sequences

20, 0, 01 is a forward-matching sequence

Concatenation preserves forward-matching property.

$$s_1, \dots, s_i, \dots, s_t \Rightarrow s_1, \dots, s_i, s_i \cdot s_{i+1}, s_{i+1}, \dots, s_t$$

**Round 2**

# Proof of Cool Claim

**Cool Claim:** For  $r \geq 2$ ,  $|L_r| = \sum_{k=1}^r \varphi(k)/2$ .

$L_{k-1}$   
 $1, \dots, x, y, \dots, 2$

$L_k$   
 $1, \dots, x, k, y, \dots, 2$

# of occurrences of  $k$  in  $L_k$

= # neighbors  $x, y$  in  $L_{k-1}$  such that  $x + y = k$

= # neighbors  $x, y$  such that  $x, y$  are co-prime and  $x + y = k$

= # co-prime pairs  $x, y$  such that  $x + y = k$

= # pairs  $x, y$  such that  $x + y = k$  and  $x, y$  co-prime to  $k$

=  $\varphi(k)/2$

# Proof of Cool Claim

**Cool Claim:** For  $r \geq 2$ ,  $|L_r| = \sum_{k=1}^r \varphi(k) / 2$ .

# of occurrences of  $k$  in  $L_k = \varphi(k) / 2$

$$\Rightarrow |L_r| = \sum_{k=1}^r \varphi(k) / 2$$

Cool Claim proved.  $\square$

Forward-Matching sequence of  $\Omega(r^2)$  strings each of length at most  $r$

$\Omega(r^2)$

# Proof of Cool Claim

**Cool Claim:** For  $r \geq 2$ ,  $|L_r| = \sum_{k=1}^r \varphi(k)/2$ .

# of occurrences of  $r$  in  $L_r = \varphi(r)/2$

$$\Rightarrow |L_r| = \sum_{k=1}^r \varphi(k)/2$$

Cool Claim proved.  $\square$

Forward-Matching sequence of  $\Omega(r^2)$  strings each of length at most  $r$

Readability of  $C_{n,n}$  is  $O(\sqrt{n})$ .

$\Omega(r^2)$

# What we showed

Bipartite Chain Graph  $\mathcal{C}_{n,n}$

$$\forall i \in [n] \quad N(a_i) = \{b_i, b_{i+1}, \dots, b_n\}$$

Readability of  $\mathcal{C}_{n,n}$  is  $O(\sqrt{n})$  using labels of 3 characters.

# Open Questions

- Other graph families of low readability ?
- Complexity of checking if the readability is at most  $k$ , for larger values of  $k > 2$ .
- Can readability be used as a parameter ? Are there hard problems that become easy on low readability graphs ?
- Close the gap between the lower bound and upper bound on the readability of bipartite chain graphs.

**Thank you!**
